Outline

- Introduction
  - Briefly Normal Mode & Expert Mode
- LHC recasting with MadAnalysis 5
  - Simplified-Fast Detector Simulation
  - NEW Improving exclusion limits statistics with likelihood
  - NEW Particle propagation module for long-lived particles
- Conclusion
- Hands-on session

Introduction

Why designing & recasting is important?

- Exploiting the full potential of LHC (for new physics)
  - *Designing* new analyses (based on MC simulations)
  - *Recasting* LHC analyses (The LHC legacy)
- Data preservation in HEP is mandatory
  - Going beyond raw data via analyses
- Related tools need to be supported by the entire community
  - Both theorists & experimentalists
- Universal recasting tool

Les Houches Recommendations (EPJC '12)

Reinterpretation Forum Report (SciPost '20)

MadAnalysis 5

What is MadAnalysis 5?

- A framework for phenomenological analyses
- Any level of sophistication: partonic, hadronic, detector, reconstructed
- Several input formats: STDHEP, HEPMC, LHE, LHCO, ROOT (from Delphes)
- User-friendly, flexible & Fast!!! (Coming soon: even faster multi-core analysis!)
- Interfaces several HEP packages: MadGraph, FastJet, Delphes, pyhf

Normal Mode

- Intuitive commands typed in the Python interface
- Analysis performed behind the scenes (black box)
- Human readable output: HTML and LaTeX

Expert Mode

- C++ programming with the SampleAnalyzer framework
- Support for multiple sub-analyses, an efficient way for handling cuts and histograms, etc.

LHC recasting with MadAnalysis 5

Simplified - Fast Detector Simulation with MadAnalysis 5

JYA, Fuks, Polykratis EPJC '21

- Prerequisite: Beginner-level English
- Simulation-based on reconstruction efficiencies, four-momentum smearing and flexible particle (mis)tagging for FS jets, leptons, photons & tracks.
  - Smearer
  - Reconstruction efficiencies
  - (mis)Tagger: now including multilevel object tagging
  - Observable Scaling (JES, energy scaling, general scaling)
  - Substructure smearing
- Fully integrated into Public Analysis Database

```
ma5> install PAD
```

- Example?

```
ma5>define smearer j with E (exp(pt)/cosh(eta))^2  [ (abseta > 2.5 or pt < 10) and pt > 100 ]
```

Search for bottom-squark pair production with the ATLAS detector in final states containing Higgs bosons, *b*-jets and missing transverse momentum

The ATLAS Collaboration

The result of a search for the pair production of the lightest supersymmetric partner of the bottom quark ($\tilde{b}_1$) using 139 fb^{-1} of proton–proton data collected at $\sqrt{s}$ = 13 TeV by the ATLAS detector is reported. In the supersymmetric scenarios considered both of the bottom-squarks decay into a *b*-quark and the second-lightest neutralino, $\tilde{b}_1 \to b + \tilde{\chi}_2^0$. Each $\tilde{\chi}_2^0$ is assumed to subsequently decay with 100% branching ratio into a Higgs boson (h) like the one in the Standard Model and the lightest neutralino: $\tilde{\chi}_2^0 \to h + \tilde{\chi}_1^0$. The $\tilde{\chi}_1^0$ is assumed to be the lightest supersymmetric particle (LSP) and is stable. Two signal mass configurations are targeted: the first has a constant LSP mass of 60 GeV; and the second has a constant mass difference between the $\tilde{\chi}_2^0$ and $\tilde{\chi}_1^0$ of 130 GeV. The final states considered contain no charged leptons, three or more *b*-jets, and large missing transverse momentum. No significant excess of events over the Standard Model background expectation is observed in any of the signal regions considered. Limits at the 95% confidence level are placed in the supersymmetric models considered, and bottom-squarks with mass up to 1.5 TeV are excluded.

Simplified & full likelihoods

Why important?

ATLAS SUSY and Exotics workshop
S. Kraml '20

- The mathematical description of the analysis is provided within its statistical model.
- The likelihood profile enables the standard statistical approaches to extract information.
- *i.e.* how reasonably aligned the theoretical predictions with the experimental observations?

Simplified likelihoods with CMS-SUS-16-039

- Correlation matrix allows us to form a covariance matrix which then used in a simplified likelihood under Gaussian approximation.

$$\mathscr{L}_S(\mu,\theta) = \prod_{i=1}^{N} \frac{(\mu s_i + b_i + \theta_i)^{n_i}\, e^{-(\mu s_i + b_i + \theta_i)}}{n_i!} \exp\left(-\frac{1}{2}\theta^T \mathbf{V}^{-1}\theta\right)$$

$$\mathbf{V} = \mathbb{E}[\theta_i \times \theta_j]$$

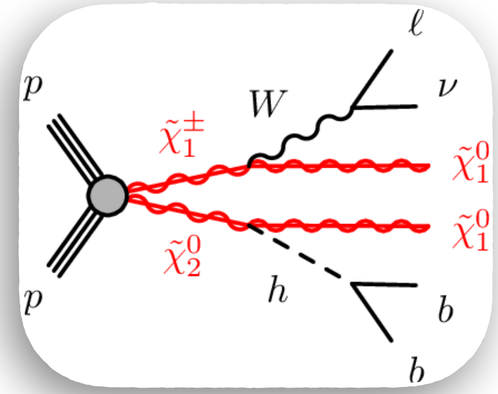
Full likelihoods with ATLAS-SUSY-19-08

Alguero, JYA, Fuks, Kraml; 2206.14870

Electroweakino searches



- Wino-like electroweakinos
- ATLAS shares HistFactory like json files to form full profile likelihoods.
- Each file includes detailed information on backgrounds and corresponding nuisance parameters.
- Simplified likelihoods are achieved by compressing all the information into single nuisance parameter.

HEPData

gz File

Archive of full likelihoods in the HistFactory JSON format described in CERN-EP-2019-188. For each signal point the background-only model is found in the file named BkgOnly.json. All jsonpatches are contained in the file patchset.json. Each patch is identified in patchset.json by the metadata field "name": "C1N2_Wh_hbb_[m1]_[m2]" where m1 is the mass of both the lightest chargino and the next-to-lightest neutralino (which are assumed to be nearly mass degenerate) and m2 is the mass of the lightest neutralino.

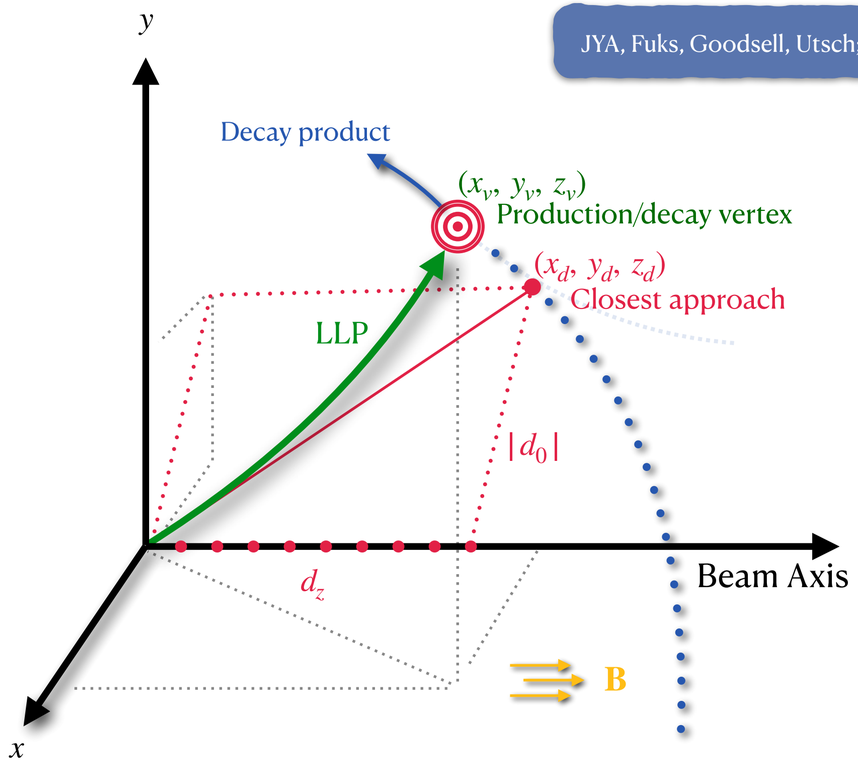
Particle propagation in SFS

JYA, Fuks, Polykratis EPJC '21

- SFS module allows for simple observable smearing based on transfer functions.
- Transverse impact parameter (d_0) and longitudinal impact parameter (d_z) can be calculated with straight trajectory assumption (default behaviour for other recasting softwares).
- Modification of particle trajectories under constant magnetic field can provide relevant effects for unusual particle signatures.

JYA, Fuks, Goodsell, Utsch; EPJC '22



Particle propagation in SFS

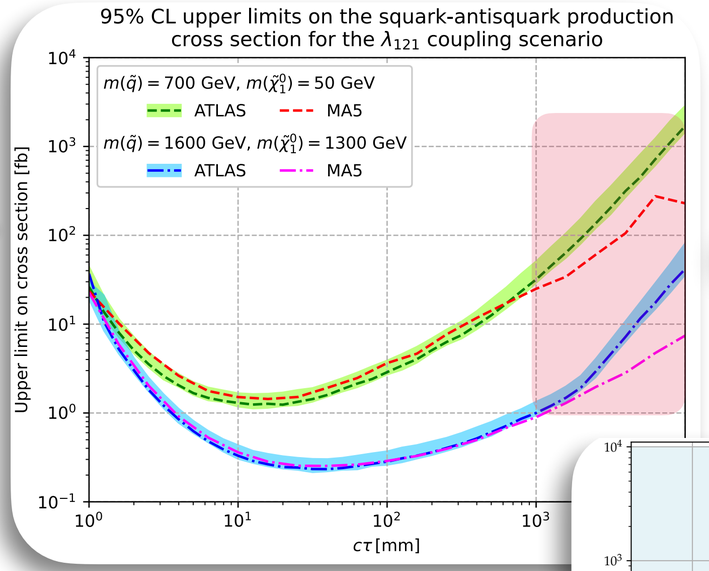
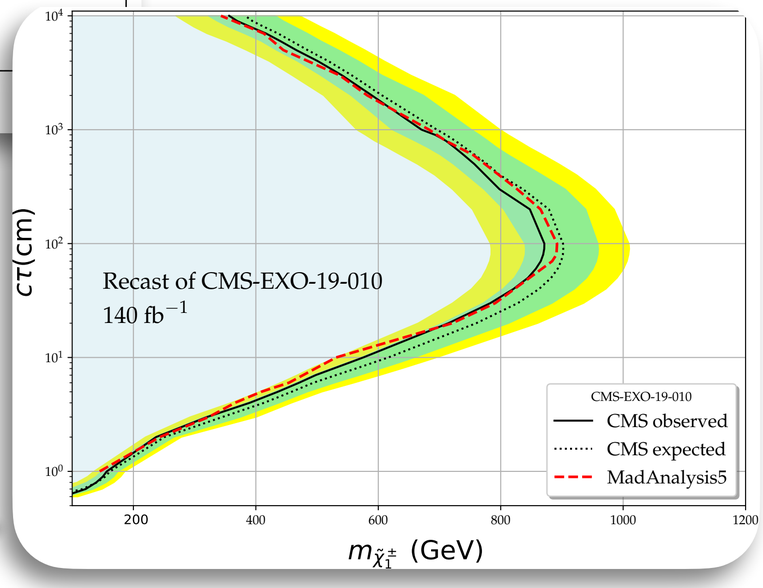
Particle propagator module and fresh LLP recasts are available in MadAnalysis 5 - v1.9_beta

- ATLAS - SUSY - 2017 - 04
- CMS - EXO - 19 - 010
- CMS - EXO - 16 - 022
- CMS - EXO - 18 - 003



$c\tau > 1$ m



For details see the MadAnalysis talk at "Tenth workshop of the LLP Community"

Conclusion

Conclusion

- Particle propagation can have a significant effect on analysis outcome, depending on the theory behind it.
- Uncorrelated signal regions do not represent the statistical model of the analysis well enough. Full or simplified statistical models are essential for better reinterpretation.

NEW MadAnalysis 5 is fully capable of using correlation matrices and full likelihood profiles to improve exclusion limits.

NEW All are available in MadAnalysis 5 version 1.10.4

WANTED: Analysis codes

Scientific reproducibility and data preservation solely depend on preserving analysis logic in a reinterpretable form. You can contribute to the HEP community by sharing the LHC recast you have implemented in the MadAnalysis 5 framework through Public Analysis Database! Please send us your analysis code, detector card, info file and validation note to be included in PAD for public use.

More information and examples can be found in the proceedings of the second MadAnalysis 5 Workshop on LHC recasting in Korea. Analysis codes have been published, documented and got a DOI so that they can now be cited.
